

# Getting started with scrapy

Scraping olx.com for bikes and cars

# Web-scraping

Extracting information from web pages and following links between pages

	<b>2010 Suzuki Access 54153 Kms</b> Scooters » Suzuki Vanagaram Mettukuppam Vivekananda Nagar, Chennai 12:34 pm	₹ 18500 
	<b>2006 Bajaj Discover 38900 Kms</b> Motorcycles » Bajaj Vadapalani, Chennai 12:34 pm	₹ 8890 
	<b>Bajaj Pulsar 22000 Kms 2015 year</b> Motorcycles » Bajaj Gerugambakkam Chakrapani Nagar, Chennai 12:34 pm	₹ 55000 
	<b>2012 TVS Apache RTR 33000 Kms</b> Motorcycles » TVS Tiruverkadu, Chennai 12:34 pm	₹ 35000 

# Scrapy

- Python framework for web scraping (and web api extraction)
- Built on top of the **Twisted** asynchronous networking library
- Extensible

# Code: Scrapy spider

- Class inheriting from `scrapy.Spider`
- Must have a `name` attribute which should be unique in the project. This is used to identify the spider
- `start_urls` specifies a list of urls to crawl additional links may be followed and crawled
- `parse(self, response)` function with the logic to handle the response received should yield `scrapy.Item` or `scrapy.Request` or `dict`
- `Scrapy.Request` objects are used follow links. It must specify `url` and `callback` function to parse the response

# Code example 1: single file

- Self contained file. Simple.
- Suitable for one time extraction / small works

# Code example 2: project structure

- Used to group multiple spiders in the same project.
- Allows for additional settings
- Handling the results

# Code example 3: Item and ItemLoader

- `scrapy.Item` allows for creating schema crawled data.
- Allows additional rules/sanity checks and preprocessing for each field.
- Separation for extraction code and data processing code.
- `scrapy.loader.ItemLoader` convenient mechanism for populating Items and parsing.
- Allows custom pre-processor definitions for pre-processing

# Questions

This was a very small introduction to scrapy. For detailed tutorial refer
